LAB211 Assignment	Type:	Short Assignment
	Code:	J1.S.P0070
	LOC:	150
	Slot(s):	3

Title

Login system of the Tien Phong Bank's Ebank

Background

(Module extracted from TienPhong Bank, ebank project)

Program Specifications

Login function of Ebank system includes:

1. Vietnamese
2. English
3. Exit

If the user selects 1: Switch the interface language to Vietnamese and perform "check login" function.

If the user selects 2: Keep the English interface and perform "check login" function.

Check the Login function:

1. Require to input an account number :

    - Check the account number must be a number

    - Each account number must be 10 digits.

2. Input a password:

    - Check length of the password which is enough length or not

    - Check the password which includes alphanumeric or not.

3. Require to input one character or multiple characters in the captcha:

    - Create a random captcha code in each login.

    - Check the input characters of captcha are correct or not.

Function details:

Function 1: Display a menu and ask users to select an option.
- User runs the program. The program prompts users to select an option.

- User selects an option, perform **Function 2**.

Function 2: Perform language based on the selected option.
Function 1: Change language
- Use the resourceBundle to get the value of the language according to the key in 2 files as En.properties and Vi.properties which are corresponding English and Vietnamese

.**Function 2: Checking account number**
- Using Regular Expression to check the validity of the account number was input at the request of the assignment.

- If the account number is invalid, it returns an error message corresponding to the language you chose.

Function 3: Check the password.
- Use a RegularExpression to check the validation of the inputted password.

- If the password is invalid, then return an error message corresponding to the language you have just selected.

Function 4: Generate a random captcha code.
- Use the Random function to generate a random sequence, and then converser to characters (type char) .
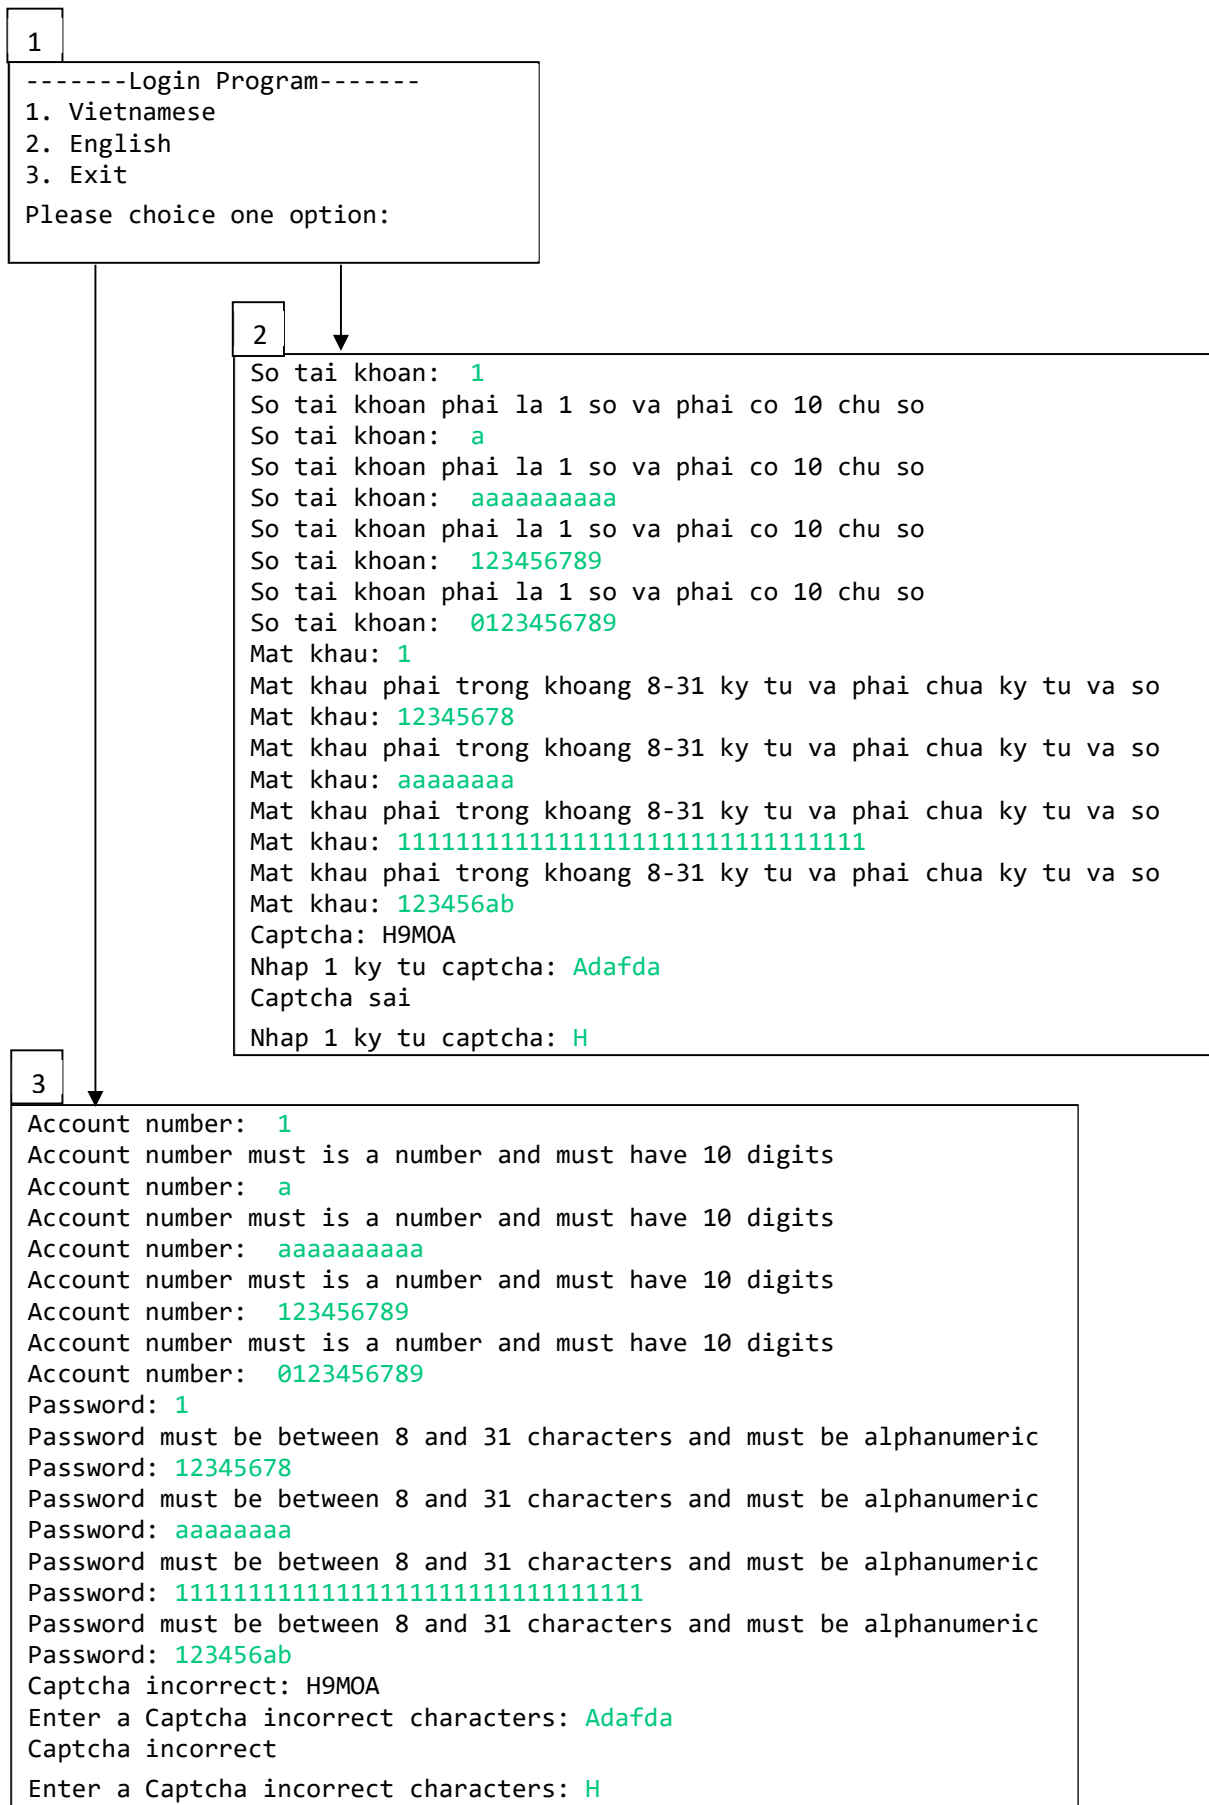

Function 5: Check the captcha code
- Use the function contains () to check the captcha characters input exists in the captcha string was born at first did not.

- If the captcha characters are invalid, then returns the error message that corresponds to the language you have selected.

Function 6: Login
- Allows the user to input the account number, password and captcha from the keyboard.

- If a valid account number, then allows the user to input a password and if the account number entered is not valid, then print out the error screen and allows the user to input again.

- If valid password then allows users to input captcha. Otherwise then print out the error screen and allows the user to input again.

- If the captcha is not valid then print out the error screen.
